Contents

1	Purpose	3
2	Installation	4
2.1	Prerequisites	4
2.2	What is in the xasbuild 1.1 distribution	5
3	What is xasbuild	6
3.1	The scripts	6
3.2	The configuration files	7
3.3	The prototype Makefiles	9
3.4	The dependency files	9
4	Running xasbuild	10
4.1	Site-dependent localisation	10
4.2	Runstring options	11
4.3	Saving a xasbuild configuration	11
4.4	Making fake dependency files for programs	12
5	Inserting new code and deleting old code in XAS	13
6	Description of the configuration files	14
6.1	Description of the filelists	14
6.2	Description of the Makefiles created by xasbuild 1.1	15
6.2.1	The top-level Makefile	15
6.2.2	The vos Makefile	16
6.2.3	The libsource Makefile	16
6.2.4	The libsource/libname Makefile	17
6.2.5	The sourcedir Makefile	17
6.2.6	What about dependencies?	17
7	Porting to other operative systems	19
7.1	Unsupported port to HP	19
7.2	Unsupported port to SUnOS	19
8	Troubleshooting	20
9	What to do in xasbuild 1.1	21
10	Files checklist for release 1.1	22
11	Change history	23

1. Purpose

The **xasbuild** set of scripts allows a generic user to build (and re-build in the development phase) the XAS 1.1 library and programs, constructing and updating Makefiles in the XAS source directories.

The set of Makefiles created by **xasbuild** is intended to allow recompilation of the existing XAS 1.1 library, demos and programs under the UNIX platforms (supported: DEC ULTRIX; unsupported: HP and SUN up to now, OSF1 coming soon). It can be useful as a maintenance tool, i. e. a tool that allows a quick insertion of patches in next releases with installation of source files and recompilation. Without **xasbuild** the update of the Makefiles at various levels of the XAS tree should have been manual, and this is felt by the authors as a potential source of serious problems and of nuisance. This is an attempt to avoid the ones and the other.

The use of **xasbuild** was kept as simple as possible with very easy and simple customisations (this somehow complicated the scripts). The main customisation (that is the way you say to **xasbuild** that there are new source files/programs/libraries in the XAS tree) is handled via external files. The syntax of these files is simple, and they can be modified with any ASCII text editor. The only environment variable that needs to be defined is \$XASTOP, pointing to the top level of the XAS directory tree. This choice allows very simple operations while updating the package and limits the errors that can be made while configuring. All operations that are performed on these configuration files are NOT site-specific.

A final "localisation" is also handled via shell script, building the site-specific Makefiles.

This set of scripts and proto-Makefiles is distributed as-is, with no support. However the author will keep track of all problems encountered if someone wants to try this package. Mail the problems to pds.sw@saxpds2.tesre.bo.cnr.it, with a synthetic description and with a copy of the logs.

In any case please have a look at the disclaimer note at the end of these instructions (hopefully physical and *psychical* damages will not arise from the use of **xasbuild**).
